

Lidar Imagery Series
LIS-2010-45122E4-Camas
Lidar Imagery of the Camas 7.5' Quadrangle,
Multnomah County, Oregon

Cartography by Ted Roberts and Sarah Robinson, Oregon Department of Geology and Mineral Industries. Additional cartography and data processing by John English, Kalena Hughes, Matthew Timon, and Rufe Hertzog, Oregon Department of Geology and Mineral Industries.
Data Source: Lidar data from DGSAMI and Puget Sound Lidar Consortium.
Lidar from 2005 and 2007.
Topographic features digitized from lidar data by DGSAMI. Feature names from Google Maps, U.S. Bureau of Land Management, U.S. Geological Survey, and ESRI.
Contours derived from bare earth elevation model smoothed by 45 x 45 averaging kernel.
Map projection: Universal Transverse Mercator Zone 10 North, North American Datum 1983.

Scale: 1:8,000
1 inch = 66.7 Feet
Contour Interval: 20 Feet
UTM grid: 1 kilometer
Water features

The bare earth image is a representation of the earth's surface stripped of man-made objects and vegetation. This is achieved by post-processing lidar point data.
The highest hit image is a representation of the lithologic surface of the terrain. Unlike the bare earth image, this image shows features such as trees, buildings, and even cars.

Lidar Data Origins and Map Image Limitations

These maps were created using data derived from lidar (light detection and ranging) technology. A lidar measurement system collects huge quantities of three-dimensional point data where laser pulses have been reflected off opaque objects such as buildings, trees, bushes, and the ground surface.
The lidar all-returns point cloud data that are the original basis for these images were collected by Waterford Sciences, Inc., Terrapoint, LLC, and Merrick and Company. The point cloud is a remotely sensed collection of three-dimensional point data that are systematically calibrated relative to GPS ground control points.
The services provided and map products produced by Waterford Sciences, Inc. and Terrapoint, LLC were performed under the supervision of a State of Oregon registered and certified Registered Land Surveyor. The bare earth and highest hit digital elevation surface models (DEM) produced by the three companies and made available by DGSAMI as the Lidar Data Quadrangle (LDQ) series, are georeferenced raster grids (ESRI format) interpolated from the point cloud data.
The map images depicted here are examples by DGSAMI using GIS techniques to extract and emphasize selected features. These map images, the interpretive content displayed, and this lidar image series are for general information purposes and are not intended to indicate the authoritative location or definition of real property boundaries, the precise shape or contour of the earth, or the precise location of fixed works of human, no warranty, expressed or implied, is made regarding the accuracy or utility of the information described and/or contained herein, nor shall the act of distribution constitute any such warranty. This disclaimer applies both to individual use of the data and aggregate use with other data. The Oregon Department of Geology and Mineral Industries shall not be held liable for improper or incorrect use of this information.
